7640 TRAVELING WAVE TUBE

#### TENTATIVE

#### **GENERAL DESCRIPTION:**

The 7640 is a 1000 watt pulse traveling wave amplifier tube having 30db gain and designed primarily for use in the 2000 to 4000 mc frequency range. It is constructed in a rugged metal envelope with a helix type slow wave structure. The integral matching circuit is in 50 ohm coaxial line and is provided with UG 19 B/U Type connectors. The tube is focused by a periodic permanent magnet which is integral with the tube. A convergent beam gun and oxide impregnated cathode are used. Duty cycles up to .01 and pulse widths up to 100 microseconds can be used.

# **ELECTRICAL RATINGS, ABSOLUTE VALUES**

Heater Voltage Heater Current Maximum Anode Voltage (Note 1)	6.3 (±10%) 3.0 8000	volts amperes volts	Maximum R-F Input Power Maximum R-F Output Power Maximum Duty Cycle	2 30 .01	watts average watts average
Maximum Shell Current Maximum Collector Voltage	0.8 8000	ampere peak volts	Maximum Pulse Width (beam) Maximum Cathode Current	100 2.0	microseconds ampere peak
Maximum Collector Dissipation	160	watts average		2.00	poto pout

## **ELECTRICAL INFORMATION**

Maximum Frequency (Note 2)	4000	mc	Minimum Cold Transmission Loss	50	db
Minimum Frequency (Note 2)	2000	mc		00	ab

#### MECHANICAL INFORMATION

## TYPICAL OPERATION AS POWER AMPLIFIER

- NOTE 1: All voltages shown are with respect to cathode. The shell is normally operated at ground potential and the anode connection is made to the shell of the package.
- NOTE 2: Useful gain and power output exists below 2000 mc and above 4000 mc and can be utilized by adjusting anode voltage to optimize the frequency range desired. However, bandwidth cannot be extended both upward and downward simultaneously and maximum gain and power output outside the normal bandwidth will be lower than rated values.
- NOTE 3: Heater warmup of two minutes before applying high voltage is recommended.
